

Grangemouth Green Hydrogen

Welcome

Thank you for participating in our Grangemouth pre-application consultation.

Green hydrogen generated by the production facility would play a critical role in decarbonising industry in Scotland. By generating hydrogen from water using renewable energy from the electricity network, the hydrogen can be produced without carbon emissions.

The green hydrogen produced will be delivered to an adjacent industrial plant via a pipeline, leading to a reduction in the CO₂ emissions of the Grangemouth industrial area.

Statutory pre-application consultation

Following further design activities and studies we are delighted to present our current proposal. You can provide feedback via our website, online exhibition, telephone, email or free post.
